

# AWS Security Assessment

## More than a standard security review

Amazon recommends all AWS customers get a Well-Architected Framework Review (WAFR). But consultants often just have you fill out an online form then base their recommendations on a couple of hours analyzing that limited dataset.

Blue Mantis AWS Security Assessments go above and beyond the standard WAFR with a minimum ten hours of hands-on experience working with your AWS environment. The result is a detailed cloud security risk mitigation plan customized to match your budget.

## Uncover persistent security threats

Effective AWS security is built on continuous visibility. Verizon's 2023 Data Breach Investigations Report noted 74% of cloud data breaches were caused by human errors, such as a misconfigured S3 bucket, often found and exploited by attackers long after the fact.

Blue Mantis AWS Security Assessments result from analyzing 30 days of anonymized telemetry data from your AWS environment using Orca Security, an agentless cloud security platform. There's nothing for your IT to manage and deploys in minutes with no performance impact to your AWS environment.

### Hands-on expert consultation to:

- Understand and mitigate potential risks related to your AWS cloud architecture
- Make data-driven decisions to align your AWS architectural designs with business outcomes
- Protect your AWS environment by finding security issues before they occur
