Platform Engineering

Gain a unified engineering solution

By 2025, Gartner estimates over 95% of new workloads will be on cloud-native platforms. Many companies adopted DevOps and containerization to streamline operations and reduce costs. However, today's CIOs now face new challenges like "tool sprawl," managing distributed configurations, and lack of real-time visibility, not to mention the issues of security and compliance.

Blue Mantis improves DevOps with our new Platform Engineering solution. We deliver a turnkey cloud-native Platform Engineering solution that supercharges your IT team's productivity by unifying, simplifying, and securing all aspects of your DevOps.

Innovate without operational friction

Implementing a successful DevOps practice requires IT to deploy complex cloud infrastructure, enterprise-level security, and an array of cloud-native software tools—with deep observability across everything. The work required by IT to cobble together disparate systems to meet constantly shifting business outcomes, security policies, and compliance regulations can often exceed the budget to deploy DevOps at most companies.

Blue Mantis removes barriers between developers and IT operations at your organization. We partnered with industry leaders Nethopper and CloudTruth to combine multiple tools and cloud infrastructure into a unified platform engineering solution.

Accelerate your time to market

Time is money, and it takes an average of two months to build and release code using a DevOps framework. Deploying a Blue Mantis Platform Engineering solution reduces build/release times to only two weeks. If you have teams of DevOps engineers, your savings can easily reach into the millions.

Schedule an assessment with Blue Mantis to see at how you can transform your IT operations today.

Automate and secure your DevOps

- Increase productivity for your IT teams with a unified platform engineering solution delivered as a service.
- Reduce time to market and accelerate your development velocity.
- Enhance security without sacrificing productivity using holistic platform-level observability and dynamic secret rotation.
