Blue Insight

Tame network complexities

According to a recent survey, 91% of IT decision makers say that network monitoring is critical for their business, but only 12% are satisfied with their current tools. As network complexity increases due to the demands of AI, remote collaboration, and data security, you need deep visibility and control into your network operations to optimize performance and protect against threats.
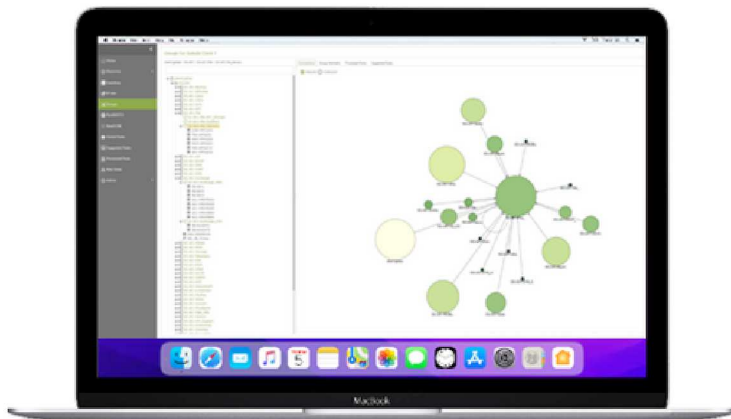

You need Blue Insights from Blue Mantis.

Gain real-time network visibility

Blue Insight networking analytics make everything about your IT networks better. Blue Insight seamlessly blends with your existing networking infrastructure—no new hardware or software required. You gain deep, real-time visibility into all app and endpoint traffic across cloud, on-prem, and hybrid networks.

A one-time Blue Insight network assessment enables you to instantly visualize and document complex app and network interdependencies that would normally take a networking engineer hours to complete. Avoid costly misconfigurations during cloud migrations, AI tool deployments, and more.

If you choose to keep Blue Insight after the assessment, Blue Mantis analysts integrate seamlessly with your internal IT teams to actively monitor your network with Blue Insight visibility tools to enhance your network health.

Benefits

- Analyzes network traffic, bandwidth, and app performance to optimize resources and lower overall costs.

- Integrates with your existing network with no agents to install and no hardware to manage.

- Provides deep insights into all network and app interdependencies to avoid costly cloud misconfigurations.
